Lean Principles and Practices

Lean principles and practices are essential components of operational excellence, focusing on the continuous improvement of processes, elimination of waste, and enhancement of value for customers. This course, the Postgraduate Certificate in Operational Excellence, delves into the core concepts of Lean to equip professionals with the knowledge and skills needed to drive organizational efficiency and effectiveness.

Key Terms and Vocabulary

1. Lean

Lean is a systematic approach to minimizing waste and maximizing value within an organization's processes. It aims to create more value for customers with fewer resources through the elimination of non-value-added activities.

2. Waste

Waste, in the context of Lean, refers to any activity or process that does not add value to the customer. There are eight types of waste in Lean, also known as TIMWOODS: Transport, Inventory, Motion, Waiting, Overproduction, Overprocessing, Defects, and Skills.

3. Value Stream

A value stream is the sequence of activities required to design, produce, and deliver a product or service to a customer. Understanding and optimizing the value stream is crucial in Lean to eliminate waste and improve efficiency.

4. Kaizen

Kaizen, which means "continuous improvement" in Japanese, is a key principle of Lean. It involves making small, incremental changes to processes on a regular basis to improve efficiency, quality, and customer satisfaction.

5. Just-in-Time (JIT)

Just-in-Time is a Lean manufacturing strategy that aims to produce goods or services exactly when they are needed, minimizing inventory and waste. JIT helps reduce lead times, improve quality, and lower costs.

6. Kanban

Kanban is a visual management tool used in Lean to control and optimize the flow of work. It involves using signals or cards to indicate when to produce or move items, helping to prevent overproduction and

improve efficiency.

7. Poka-Yoke

Poka-Yoke, or mistake-proofing, is a Lean technique that aims to prevent errors by designing processes in a way that makes mistakes impossible or immediately noticeable. Poka-Yoke helps improve quality and reduce defects.

8. Gemba

Gemba, which means "the real place" in Japanese, refers to the concept of going to the actual location where work is done to observe, understand, and improve processes. Gemba walks are a common practice in Lean to identify opportunities for improvement.

9. 5S

5S is a Lean methodology for organizing a workplace to improve efficiency and effectiveness. The five S's stand for Sort, Set in Order, Shine, Standardize, and Sustain, outlining a systematic approach to workplace organization and cleanliness.

10. Value Stream Mapping

Value Stream Mapping is a visual tool used in Lean to analyze and improve the flow of materials and information through a process. It helps identify waste, bottlenecks, and opportunities for improvement in the value stream.

11. Heijunka

Heijunka, or production leveling, is a Lean practice that aims to smooth out production volume and mix over time to reduce fluctuations and improve efficiency. Heijunka helps balance workload, minimize inventory, and meet customer demand.

12. Andon

Andon is a visual control device used in Lean to signal problems or abnormalities in a process. It typically involves lights or displays that indicate when assistance is needed, helping to enable quick responses and prevent defects.

13. Jidoka

Jidoka, or autonomation, is a Lean principle that focuses on building quality into processes by empowering workers to stop production if a defect is detected. Jidoka helps prevent defects from being passed down the line and ensures quality at the source.

14. Standard Work

Standard Work is a Lean practice that involves documenting the best-known way to perform a task or process, based on current practices. It serves as a baseline for continuous improvement and helps ensure consistency and quality.

15. Takt Time

Takt Time is the rate at which a product must be produced to meet customer demand. It is a key concept in Lean manufacturing to help balance production and ensure that work is completed at a consistent pace.

16. Pull System

A Pull System is a Lean production method where work is pulled through the system based on customer demand, as opposed to being pushed based on forecasts. Pull systems help minimize inventory, reduce waste, and improve responsiveness.

17. Total Productive Maintenance (TPM)

Total Productive Maintenance is a Lean approach to maintaining equipment in optimal condition to prevent breakdowns, defects, and delays. TPM aims to maximize equipment effectiveness and overall equipment efficiency.

18. Value-Added

Value-Added activities are those that directly contribute to meeting customer requirements and are considered essential to the production process. Identifying and focusing on value-added activities is crucial in Lean to eliminate waste and improve efficiency.

19. Non-Value-Added

Non-Value-Added activities are those that do not contribute to meeting customer requirements and are considered wasteful. Eliminating or reducing non-value-added activities is a key focus of Lean to streamline processes and improve productivity.

20. Continuous Improvement

Continuous Improvement, or Kaizen, is a fundamental principle of Lean that emphasizes making ongoing, incremental changes to processes to achieve better results. It involves engaging employees at all levels to identify and implement improvements.

21. Root Cause Analysis

Root Cause Analysis is a problem-solving technique used in Lean to identify the underlying causes of issues or defects within a process. By addressing root causes, organizations can implement effective solutions and prevent recurrence.

22. Bottleneck

A Bottleneck is a point in a process where the flow of work is impeded, causing delays or inefficiencies. Identifying and addressing bottlenecks is essential in Lean to optimize flow and improve overall performance.

23. Lead Time

Lead Time is the total time it takes to complete a process, from the initiation to the final delivery. Understanding and reducing lead times is a key objective in Lean to improve efficiency, responsiveness, and

customer satisfaction.

24. Cycle Time

Cycle Time is the time it takes to complete one cycle of a process, from start to finish. Monitoring and reducing cycle times is important in Lean to increase productivity, reduce waste, and enhance overall performance.

25. Hoshin Kanri

Hoshin Kanri, or policy deployment, is a Lean strategic planning process that aligns organizational goals with daily operations. It involves setting objectives, creating action plans, and monitoring progress to drive continuous improvement.

26. Visual Management

Visual Management is a Lean practice that uses visual cues, such as charts, graphs, and displays, to communicate information quickly and effectively. Visual management helps enhance communication, monitor performance, and drive improvement.

27. A3 Thinking

A3 Thinking is a problem-solving methodology used in Lean, named after the standard A3 paper size. It involves using a structured approach to define a problem, analyze root causes, develop solutions, and plan for implementation.

28. Overall Equipment Effectiveness (OEE)

Overall Equipment Effectiveness is a metric used in Lean to measure the efficiency and performance of equipment. OEE considers availability, performance, and quality to identify opportunities for improvement and optimize equipment utilization.
